High Potassium

high potassium and phosphorus blend

☐ *20 ltr*   ☐ *200 ltr*   ☐ *1000 ltr*

Fair Dinkum Fertilizers High Potassium foliar fertilizer is a product designed to address potassium deficiencies. Being a foliar fertilizer most of the potassium in the product gets into the plant and is immediately available if applied correctly.

The product contains no added chloride so its use avoids the problems associated with high chloride fertilizers such as muriate of potash. It also contains small amounts of the essential nutrients nitrogen, phosphate and sulphur all in a readily absorbed form. The product should only be used in response to a known potassium deficiency from soil or leaf tests.

This product is not designed for general use, and is designed to minimise the effect of potassium deficiencies.

Directions:

Mix 1 part High Potassium with at least 7 parts water.

DO NOT apply if temperature is over 23 degrees C. If possible apply in late afternoon, early evening.

Product may be tank mixed with Superfine, Premium or Spurt liquid seaweed.

It should not be mixed with Fair Dinkum Fertilizers Gold.

The water and High Potassium should be added to the tank first then Premium or Spurt added.

Pasture:

Use up to 15 ltrs per hectare of High Potassium, treatment may be repeated at four weekly intervals during the high growth period and at six weekly intervals in the moderate growth period.

Do not apply if soil moisture and growth are low.

High Potassium - 20 ltr
